

Company knowledge, in one place.

Find documents, understand their status, and know who is responsible for the next step.

TWO CONNECTED AREAS

Project documents

Required files for a specific project.

The owner defines stages and document requirements, assigns people, and controls access. Uploads move through a review workflow.

Research library

A shared reference library for the company.

Employees choose or create classifications, upload files, and browse knowledge. A reference can be linked to a project without requiring a project review.

Which area should I use?

A required technical drawing for Project X? Use its project document requirement.

A general study about a material? Upload it to the research library.

Useful in both places? Keep the research reference and link it to the project.

Your project workspace

The project screen brings required documents, responsibilities, and progress together.

- 1

Choose the project

Use the project selector. You see projects that your account can access.
- 2

Read the overview

Approved, awaiting action, and readiness summarize the required document statuses.
- 3

Find the document

Each stage lists its requirements, latest file version, responsible employee, and reviewer.
- 4

Use its actions

View opens the file. New version uploads a revision. Access is available to project owners.

Plan the documents before uploading files

A requirement is a named place for one document and its versions. Stages organize when it is needed.

Different people, different responsibilities

One document. Multiple versions. One reviewer.

Uploading saves a draft. Submitting sends that version into its assigned review workflow.

What to click

Uploader: New version, choose the file, then Submit.

Reviewer: View, then Approve or Request changes. These buttons start the review and save the decision.

The current screen saves preset review comments. It does not provide a custom feedback editor or email alerts.

Build the company's shared reference library

Research documents are available to signed-in employees and do not use the project review pipeline.

The screenshot shows the Verdant Document Hub interface. The top navigation bar includes the Verdant logo, 'DOCUMENT HUB', and tabs for 'Projects', 'Research', and 'Activity'. A search bar for 'Search document metadata...' is present, along with the user profile 'Ananya Rao, Project owner'. The main content area is titled 'OPEN COMPANY KNOWLEDGE' and 'Research library'. A note states: 'Any employee can classify and upload reference files. This section has no project-review workflow.' On the right, there are buttons for '+ Classification' and 'Upload file'. A card on the left, under the 'Metals' category, displays a document titled 'High-strength steel comparison' with a description: 'Reference notes covering candidate grades and typical properties.' It also shows 'Uploaded by Mira Nair' and an 'Approved reference' badge from 'Ananya Rao'. At the bottom of the card are buttons for 'View high-strength-steel-comparison.pdf', 'Link to Project X', and 'Endorse'.

1 Classify the knowledge

Choose Classification. A parent classification lets you build nested topics.

2 Upload the reference

Choose Upload file. Select a classification, add the title and description, and choose a file.

3 Read and reuse it

Use View to open the file. Link it to the currently selected project when relevant.

4 Recognize useful work

An administrator can Endorse a reference. This is a badge, not a publication gate.

Share the right file. See what happened.

Project membership, document-only access, and the activity log serve different needs.

Shared with me

A visitor can open explicitly shared files without seeing the full project. Owners use the document's Access button to grant access.

Project activity

Open Activity to see recorded project actions, the employee involved, and the time. The log supports traceability of uploads and reviews.

A practical routine for each role

Keep the document name stable; use versions when the same document changes.

As the responsible employee

1. Open your project and find the requirement.
2. Use New version to upload the file.
3. Check the preview, then Submit.
4. If changes are requested, revise and submit a new version.

As the reviewer

1. Open the project and locate a submitted document.
2. Use View to examine the latest file.
3. Choose Approve or Request changes.
4. Check Activity to confirm the recorded decision.

Find a document quickly

Use the top search bar with a title, type, or description. Open the result's project or research area, then use View.

Keep requirements clear

Use separate requirements for different parts, such as 'Technical drawing - front assembly'. Revised files belong to that requirement's version history.

Know this version

Search uses document metadata, not full document contents or semantic topics. PDF and common image files are best for in-browser viewing; Office files are not automatically converted. Historical versions are stored; side-by-side change comparison is not provided.

Open Verdant on your own computer

For a local demonstration, use the product branch and its Windows setup helpers. Docker is not required.

1 Prepare the computer

Install Git, Python 3.12+, Node.js 22.13+, and PostgreSQL 16+. Start PostgreSQL and keep its administrator password available.

2 Clone and install

Clone the product-architecture-postgresql branch. In its folder, run the installer with -DemoData to create sample accounts in an empty database.

```
powershell -ExecutionPolicy Bypass  
-File .\Install-Verdant.ps1 -DemoData
```

```
powershell -ExecutionPolicy Bypass  
-File .\Start-Verdant.ps1
```

3 Sign in and explore

Open <http://localhost:3000>. Start with the owner account, then try the responsible employee, reviewer, and visitor accounts.

Sample accounts

All use password: **verdant-demo**

EMP-1042

Owner / administrator

EMP-1071

Responsible employee

EMP-1088

Assigned reviewer

VIS-1100

Document-only visitor

Run each PowerShell command above as one line. Use Stop-Verdant.ps1 to stop the app, and Start-Verdant.ps1 after restarting Windows. Full installation steps: LOCAL-RUN.md in the repository.
